

Red Sea Markup Language v3.0.0

WARNING

This documentation refers to RSML v3.0.0+, which is currently in development. Said version introduced major changes to how RSML works, with a full rewrite in C#.

Red Sea Markup Language is the powerful and robust fork of [MF's CrossRoad Solution](#), a language designed to **dynamically interpret different logic paths based on the local host OS and CPU architecture**.

RSML, which is short for Red Sea Markup Language, is still in development, but the finished v3.0.0 will observe the following core features:

- A complete toolchain featuring buffers, readers, lexers, parsers and evaluators.
- The core library available in C#, Visual Basic, Python and many other languages.
- SDK for convenience and a more idiomatic usage of RSML in C#.
- A native shared library for those using RSML in C, C++ or languages that don't have official bindings.
- A CLI for interacting with the RSML toolchain easily.
- A static website for evaluating RSML on the go.
- First-class support for Visual Studio.
- Syntax highlighting for Visual Studio Code, JetBrains IDEs, Notepad++ and more.

Useful Links

To further enhance your experience with RSML, we offer a list of links that will prove rather useful.

- [GitHub Repository](#): the official repository for RSML contains the C# source code for the core library, the SDK, the CLI, the native exports, the respective test projects and the documentation you're currently browsing. Contributions are very much accepted.
- [RSML NuGet Package](#): the NuGet package for the core RSML library. There are 2 core packages available for RSML, which are the recommended modern one (the link refers to this one) and the deprecated [legacy](#) package.

Changelog

v3.0.0-prerelease1 (in development)

Currently in development, will lead to the biggest RSML release yet: **v3.0.0**.

Features

- *(buffer)* Add and test `TryGetLineFromIndex` method to the read-only string buffer (#57)
- *(buffer)* Add methods for calculating the length of a line in the buffer (#58)
- *(buffer)* **[breaking]** Add array-based methods to the read-only buffer interface and class, for convenience (#53 closed by #59)
- *(buffer)* Add properties for checking if a source is read-only and checking its cursor position

Bug Fixes

- *(buffer)* Fix methods and line counting mechanics in the read-only string buffer
- *(test)* Fix MTP setup

Refactor

- *(cache)* Move `ISupportsCache` to a dedicated cache directory (and namespace)

Documentation

- Improve documentation partially

Testing

- Add more tests

- **[breaking]** Add test projects for testing RSML, RSML's SDK and RSML's Native exports

Miscellaneous Tasks

- Migrate to MTP
- Move the MTP migration property to a props file
- Comment out the release step (the only goal is testing)
- Fix workflow to avoid parser error on Windows ARM64
- Update workflow to avoid linker issues
- Prefer bash over PowerShell to avoid YAML escaping issues
- Improve README.md and add test badges
- Debug release workflow on macOS
- Debug release workflow on Linux ARM64
- Make the CLI non-packable

2.0.0 @ 2025-09-09

Breaking changes for performance sake.

Performance

- Its actually good now

1.0.0 @ 2025-05-28

First public RSML release.
